

block A

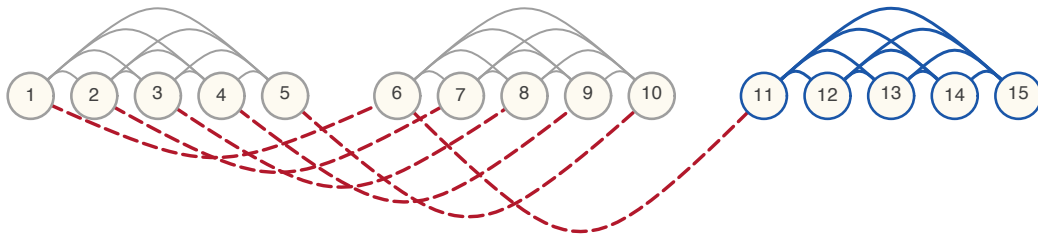

$$\lambda^* = 0.6$$

block B

$$\lambda^* = 0.6$$

block C

$$\lambda_C^* = 0.74$$

within-A, within-B edge - F_A, F_B shared by every respondent ($n = 600$)

within-C edge - ONE minority M (30%) carries all ten C edges

planted distractor (6 pairs) - disjoint 15% subsets, no shared carriers; δ calibrated: pooled $|p|$ = within-C

latent responses dichotomized at fixed block-balanced thresholds $\rightarrow$ 15 binary items
